

Safety Hazard Registry

OptiMeal / Empyria - input for the safety validator (deterministic rules layer)

This is a draft written by Claude, not an authoritative source. Every rule below is a starting point for Harris to correct from professional knowledge. Nothing here is validated until it has been reviewed on paper, corrected, and signed. Strike anything you would not stand behind - cutting is the first job, not the last one. A registry of seven rules you own beats eleven where four are approximate.

What this registry is for. The safety validator checks every generated recipe before the user sees it. It has two layers: the deterministic rules on this sheet (machine-checkable, only ever built from signed entries), and a model-review backstop that re-reads the whole recipe for general mishandling of sensitive products beyond these named rules. This sheet feeds the first layer only. Validator v1 ships on the signed entries and nothing else.

Already decided elsewhere (listed here so the registry is complete): flag behaviour is correction-and-regenerate, never blocking (signed, cooking-times doc); after 2 failed corrections the recipe is served and the flag logged (confirmed 19 Aug); the poultry/pork doneness rule is enforced by deterministic injection of the signed juices_run_clear cue (confirmed 19 Aug).

How to review each entry: tick KEEP, or strike the whole entry, or reword it in the correction space. Correct any draft temperature - the numbers are Claude's drafts and carry no authority. The detection line describes what the validator can actually catch; correct it if it would miss how the mistake really shows up in a home kitchen.

Active rules - draft eleven

H1 - Poultry and pork doneness is verified, never assumed	KEEP ☒ STRIKE ☐
<i>Status: ALREADY SIGNED (cooking-times doc) and enforcement confirmed 19 Aug. Listed for completeness: nothing to re-sign here.</i>	
The rule as the app enforces it: Every step that cooks poultry or pork carries the signed juices_run_clear verification: cut into the thickest part - white throughout, clear juices, no pink - or a thermometer in the thickest part.	
How the validator detects it: Deterministic: any poultry/pork step missing the juices_run_clear cue is flagged regardless of stated time. Identification via a closed poultry/pork name list (drafted separately for your review).	
On flag: The app sets the signed cue on the step itself - deterministic injection, never forgotten, no regeneration needed.	
Your correction (rule in your own words, or corrected values):	

H2 - Minced and comminuted meat is cooked through - no pink, ever

KEEP ☒ STRIKE ☐

The rule as the app enforces it: Whole-muscle beef and lamb are surface-pathogen cases: a proper sear addresses them and interior doneness is preference (your signed reasoning). Minced, burgers, sausage, and anything comminuted are not - surface becomes interior. These are always cooked through with no pink remaining.

How the validator detects it: Deterministic where possible: minced/burger/sausage ingredient plus any rare/pink/medium doneness language, or a missing cooked-through instruction, is flagged. Model backstop for phrasing the trigger list misses.

On flag: Correction directive and regenerate; if it persists, the cooked-through instruction is injected in your signed wording (wording to be signed with this entry).

Your correction (rule in your own words, or corrected values):

H3 - Temperature floor - no core temperature below the instantaneous minimum without a stated hold time

KEEP ☒ STRIKE ☐

Status: rule already PERMANENT (17 Aug decision). The temperatures below are Claude's drafts and are the part needing your correction.

The rule as the app enforces it: Any stated core temperature below the instantaneous minimum for that protein, with no hold time stated, is flagged. DRAFT minimums to correct: poultry 74 C; minced meat and sausage 71 C; pork whole-muscle 63 C plus 3 min rest; fish 63 C. Correct, replace, or strike any value.

How the validator detects it: Deterministic: parse stated temperatures in steps against the signed minimum for the identified protein class.

On flag: Correction directive naming the protein and the signed minimum; regenerate.

Your correction (rule in your own words, or corrected values):

H4 - Marinade that touched raw meat is never served as-is

KEEP ☒ STRIKE ☐

The rule as the app enforces it: A marinade that has been in contact with raw meat, poultry, or fish is discarded, or brought to a full boil before any use as a sauce, glaze, or drizzle. Late-stage brushing with raw-meat marinade counts as serving it.

How the validator detects it: Deterministic trigger: marinade language plus serve/drizzle/glaze/reserve language without a boil instruction between them. Model backstop for indirect phrasings.

On flag: Correction directive; regenerate with the boil-or-discard instruction required.

Your correction (rule in your own words, or corrected values):

H5 - Cooked rice and grains - cool fast, chill promptly, reheat hard, ☒ KEEP ☐ STRIKE [] once

The rule as the app enforces it: Cooked rice and grains left warm grow *Bacillus cereus*, and reheating does not undo the toxin. Recipes never instruct leaving cooked rice at room temperature beyond brief cooling; leftover rice is reheated piping hot throughout, once. Directly relevant to Fridge Clearer, where leftover rice is a common input.

How the validator detects it: Deterministic trigger: rice/grain plus room-temperature holding language or overnight-on-counter language; leftover-rice usage without a reheat-thoroughly instruction. Model backstop otherwise.

On flag: Correction directive; regenerate.

Your correction (rule in your own words, or corrected values):

H6 - No holding perishable food in the danger zone ☒ KEEP ☐ STRIKE []

The rule as the app enforces it: No step instructs holding cooked or perishable food at room temperature beyond roughly 2 hours (DRAFT figure - correct it), and never overnight on the counter. Cooling for storage happens fast and moves to the fridge.

How the validator detects it: Deterministic trigger: rest/hold/leave language with a stated duration beyond the signed limit on perishable ingredients. Model backstop for unstated-duration phrasings such as 'leave out until the evening'.

On flag: Correction directive; regenerate.

Your correction (rule in your own words, or corrected values):

H7 - No partial cooking of meat to finish later ☒ KEEP ☐ STRIKE []

The rule as the app enforces it: Meat, poultry, and fish are never partially cooked with the intention of finishing after a gap - the interior spends too long in the danger zone. Par-cooking vegetables is fine; interrupting protein cookery is not.

How the validator detects it: Deterministic trigger: par-cook/partially cook/finish later language on a protein step with a gap between. Model backstop otherwise.

On flag: Correction directive; regenerate.

Your correction (rule in your own words, or corrected values):
