

H8 - Raw or undercooked egg in no-cook preparations is called out KEEP ☒ STRIKE ☐

The rule as the app enforces it: Preparations that serve raw or barely-cooked egg - fresh mayonnaise, aioli, tiramisu, mousse, sauces that never reach cooking temperature - must state that the eggs are raw and instruct pasteurised or very fresh eggs, with a caution for vulnerable groups (pregnant, elderly, young children, immunocompromised).

How the validator detects it: Deterministic trigger: egg in the ingredient list with no cooking step reaching it, or named raw-egg dish patterns. Model backstop otherwise.

On flag: Correction directive adding the note; regenerate. Wording of the user-facing caution is signed content - yours.

Your correction (rule in your own words, or corrected values):

H9 - Fish served raw must be fit for raw consumption KEEP ☒ STRIKE ☐

The rule as the app enforces it: Ceviche, tartare, sushi-style and cured-only preparations must instruct sushi-grade or previously-frozen fish. Acid does not kill parasites - citrus 'cooking' in ceviche is texture, not safety.

How the validator detects it: Deterministic trigger: raw-fish dish patterns (ceviche, tartare, crudo, sushi, gravlax) without the sushi-grade/previously-frozen instruction. Model backstop otherwise.

On flag: Correction directive; regenerate.

Your correction (rule in your own words, or corrected values):

H10 - Stuffed and rolled meats - the centre counts as the inside of a burger KEEP ☒ STRIKE ☐

The rule as the app enforces it: Stuffing and rolling turns surface into interior, same reasoning as mince. Doneness on stuffed or rolled poultry and meat is verified at the centre of the stuffing or roll, not the flesh alone.

How the validator detects it: Deterministic trigger: stuffed/rolled/roulade language on a meat or poultry step; verification instruction must reference the centre. Can reuse the cue-injection path from H1.

On flag: Inject or regenerate with centre-verification in your signed wording.

Your correction (rule in your own words, or corrected values):

H11 - Leftovers are reheated piping hot throughout, once

KEEP ☒ STRIKE ☐

The rule as the app enforces it: Reheated leftovers reach piping hot all the way through - not warmed - and are reheated once, never cycled. Directly relevant to Fridge Clearer's leftover inputs.

How the validator detects it: Deterministic trigger: reheat/warm-up language with low-heat or until-warm phrasing on perishable leftovers; missing piping-hot-throughout instruction. Model backstop otherwise.

On flag: Correction directive; regenerate.

Your correction (rule in your own words, or corrected values):

Blank entries - anything missing

Hazards you see in real kitchens that this draft missed. Same format: rule, how it shows up, what the app should do.

H12 - Fermentation Processes

I would like that Harris stay out of fermentation if someone for example asks for Kimchi. Harris should mention that normal long fermentation is not advised, therefore he proposes a "quick ~~for~~ pickle" technique

H13 -

Someday list - inactive placeholders, not part of v1

Per the 18 Aug decision these are unsourced and stay OUT of the validator until sourced and signed on their own pass. They are named here only so they are never forgotten. Do not sign these now.

- S1 Shellfish handling (live mussels/clams: discard open-before / unopened-after, storage) - unsourced placeholder.
- S2 Raw flour and raw dough tasting - unsourced placeholder.
- S3 Raw sprouts consumption - unsourced placeholder.

Review checklist

Tick each item once you have actually done it, then sign at the bottom.

☒	Struck every hazard I would not stand behind professionally.	Notes:
☒	Reworded every kept rule into my own language where the draft is not how I would say it.	Notes:
☒	Corrected or replaced every draft temperature in H3. These were Claude's drafts.	Notes:
☒	Corrected the draft 2-hour figure in H6.	Notes:
☒	Confirmed each detection line matches how the mistake actually shows up in a home kitchen.	Notes:
☒	Wrote or scheduled the signed wording for user-facing text (H2 cooked-through line, H8 caution).	Notes:
☒	Added any hazard common in home kitchens that is missing (blank entries).	Notes: Not any, simply what I thought
☒	Confirmed the someday list stays inactive and unsigned.	Notes:

Reviewed and corrected by	Date	Version
Chet Harris	21.08.26	0.1 draft

Signing this sheet means the rules above are yours, not Claude's. Until it is signed, treat every rule in this document as unverified, and the safety validator's deterministic layer does not get built from it.
